

TOUCHSCREEN HMI LAGOS

TOUCHSCREEN

HMI LAGOS

Referential image of the Touchscreen panel

DESCRIPTION

The Lagos HMI touchscreen is a very useful addon for your paint booth. It serves detailed information to know the current state of the equipment and to optimize working times through preprogrammed recipes.

Any professional painter could operate the booth without prior knowledge of the system and adapt in a minimum amount of time.

TECHNICAL FEATURES

INCHES	7"
INSTALLATION	On the booth frontal panel or independent rack
BRAND	Schneider Electric
RESOLUTION	800 X 480 px

Smartbooth®
technology

Referential image with frontal panel mount

1. Tailor made recipes:

The HMI includes preprogrammed configuration for the most used working stages used by the painter, (masking, primer, paint, varnish, low drying, high drying...).

With a single click we configure the entire cabin to carry out a specific process with the indicated times.

Advantages:

1. Minimizing setup errors that may come from manual parameter settings.
2. Reduce configuration times to zero. Just a simple touch is enough to make the booth work as intended.

2. Detailed Information

The HMI will inform you at any time of the current state of your equipment with detailed info of the process and other possible alarms or warnings.

Advantages:

1. Record detailed info of the painting operation to perform productive improvement on your workshop.
2. Easily report anomalies to the customer service department of Lagos, reducing downtimes of the machine.

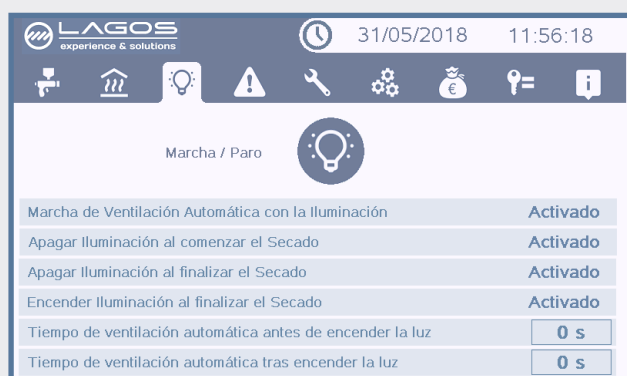

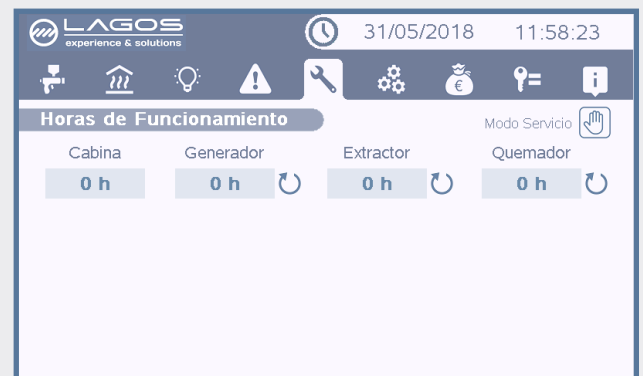

3. Smart counters

The smart counters on the HMI panel will help you schedule maintenance and revision tasks, warning you when it is necessary to carry out interventions based on the cumulative hours of work of each piece.

Advantages:

1. Better management of process times
2. Better programming of maintenance tasks, reducing possible failures.

4. Energy savings

The HMI panel manages to reduce possible bad habits that can occur with the onfiguration of a paint booth and that may have a negative impact on the energy consumption, such as forgetting the lighting on during the drying process where it is not required.

You can also create custom events based on specific needs (customizable by software)
